

Chapter 1

Inroduction

In recent year Government has taken many step to improve its online services, like Online payment collection of bills, providing information to its branches through internet and getting the response, online various exam form related to government job, but still we are lagging in rural sector whereas in rural area roads, electricity and water reached out When we talk about technology used in rural area like computer based services many villages are totally depend on small city nearby that village, not only people of that village depend on that small city but also government officers also depend. To minimize dependency on small city as well as minimizing time taken by government services to complete its work.

The main objective of this project is to reach government service in a digital way With the help of this project better communication may be developed between government service providers and the public and in this way it is helpful in information distribution Panchayat staff will accept this application and verify and send this application to head office from where application will be approved. And the users can see the information of all the processes in the option of application status. At present all the services are done offline or in paper medium in that the villagers have to go for all the information in the Panchayat office and they face many difficulties Enough line method the users may not know the application status in a proper way. They face many difficulties and they are unable to know where their application is posted in a proper way or not. With the help of digital Gram Panchayat services the users may fill a form in an online way so they can see all the application status in their mobile in an easy way. That is all the information about whether the application is approved or rejected. The users can get easily information and they don't have to go Panchayat office many times. And panchayat offices also do their work in an easy way and they also have no loads of file or paper. The details of all the schemes will be shared on the website and by clicking in particular the user may fill the form.

We are trying to build a software which will help Grampanchayat to do following work :

- 1) Birth Registration Details
- 2) Death Registration Details
- 3) Marriage Registration Details

1.1. Need of Project

Various states governments have also taken various innovative steps to promote e-governance and drawn up a roadmap for IT implementation Various projects are being implemented for improving the service delivery to the citizens through e-governance. But still most of the work in grampanchayat is done on paper, most of the documents issued by Gramsevak are on the paper. Delay in that process lead to loss of villager related to his work Schemes may avail by the bogus people, there is chance of misuse of the scheme fund Documents and information related to the schemes related to villager may be loss, and then villager will have to again apply for the related document. Which not only increases workload of the Gramsevak, it also create problem for the villager.

1.2. Aim and Objectives

1. Villages will get the information about government services and related documents digitally from gram panchayat.
2. The other objective of digital gram panchayat service is to reduce paper consumption and also the workload of servants of gram panchayat
3. The Transparency of communication between gram panchayat and service users
4. Villages & gramsevak work under and get information on their account
5. This is to reduce the time of villagers who visits the panchayat office frequently to get the information about scheme /services.

1.3. Proposed System

13.1 Analysis the Problem

Today we have various scheme by the government which are done manually still most of the work in gram panchayat is done on paper most of the document issued by gramsevak are on paper to store all those documents or paper are big challenge or problem for gramsevak or panchayat servants Document and information related to the scheme related to villagers may be lost and the villager will have to apply again for that. These all increase the workload of gramsevak and also create problems for the villagers By using digital gram panchayat service we can solve the problem.

1.3.2. Problem Definition

Grampanchayat Automation System is Web based application which deals with the problem of accessing and providing all activities of grampanchayat. Panchayat provides online services to the people living in that panchayat. It helps for the people in that area to easily complete their work which involves the action of authority of the panchayat people The grampanchayat member can access and maintain their records from the database. The gram panchayat provide birth registration form, death registration form and marriage registration form etc. They keep records of their monthly & yearly budge.

1.4 Existing System

The manual record keeping has created a new scenario that not only stresses on the classical concept of the “Registers but also on the modern concept of “service”. It is this level of service that maintains security and decrease the headache of human. To provide a high accessibility of service we have design the system so that potential security guard need not to do manual entry on registers as it time taking Requires multiple registers to store data.

Chapter 2

Literature Review

Grampanchayat provides online service to the people living in that area. All the services which are done manually are made online in the project.. All the applications and registration forms are applied and verified online. The gram panchayat provide birth registration form, death registration form and marriage registration form etc. They keep records of their monthly & yearly budge.

Chapter 3

Feasibility of study

Feasibility study is the text of the system proposal according to its work ability impact on the organization to meet the user needs and effective use of the resources. The following points need to be considered while studying the feasibility of the proposed system.

3.1. Technical Feasibility:

Technical feasibility study determines whether the organization has the technology and the skills necessary to carry out project. If not then it determines how they should be obtained. In this proposed system. The existing technology satisfies the need for the system that is available. Therefore the system is feasible.

3.2. Operational Feasibility:

Operational feasibility study determines if proposed system satisfies the user's objectives and can be fitted into EXISTING system operation. Our proposed system will certainly satisfy the user's objectives and will enhance their capability. The proposed system can be best instead of EXISTING system operations. Therefore the system is operationally feasible.

3.3. Economic Feasibility:

It is also important that our system should be economically feasible and this measure of the cost effectiveness of a project. This is often called a cost benefit analysis. The software and hardware required for this system are easily available now a day. No additional cost will be incurred for expensive software or hardware. The system will also reduce lots of paperwork chances of errors is very minimum and provide consistent information on this will lead to better output and will save lots of money.

3.4. Behavioral Feasibility:

People are inherently resistant to change and computer has been known to facilitate changes. An estimate should be made at how strong a reaction the user staff is likely to have towards the development of a computerized system. It is common knowledge that the computer installation has something to do with turnover, transfer, retraining, and changes in employee job status. Therefore, it is understandable that introduction of a candidate system requires special effort to educate, sell, and train the staff on new ways of conducting business.

Chapter 4

4.1. Methodology

This project contains 2 modules:

- 1) Admin
- 2) User

1) Admin:

At first login into the website. He monitors all functionalities carried out in the system He generates login-id and password to president and secretary He sent the Request and complaints to the officials.

2) User:

At first register the user. If you already register login into the system. If you want any application and select the application apply it.

1. Add()

This is for adding information in the database. If user information adds at first time then information will save in the user's table

2. Edit()

If user wants to edit some information from table. At that time we can edit that record.

3. Delete()

If user wants to delete certain information from table. At same time we can delete that information.

4. View()

If user wants to view certain information from database At that time we can view that record.

4.2.Requirements

4.2.1 Software Requirements

Operating System : Windows 8/10/11

Front End : Java

Back End : MySQL 8

1.2.2 Hardware Requirement

Processor : INTEL® PENTIUM® CPU 997 @ 1.60GHz 1.60GHz

System Bus : 32-BIT

Operating System RAM :2 GB

Key Board :108 Keys

Chapter 5

System Design

5.1. System Architecture

5.2 Data Flow Diagram

5.3. E-R Diagram :

5.4. Use Case Diagram :

5.5. Class Diagram

5.6. Deployment Diagram :

5.7 Activity Diagram

5.8. State Chart diagram

Chapter 6

Software Development Environment

6.1 Introduction to JAVA:

Java was originally developed by James Gosling at Sun Microsystems and released in May 1995 as a core component of Sun Microsystems Java platform. The original and reference implementation Java compilers, virtual machines, and class libraries were originally released by Sun under proprietary licenses. As of March 2022, Java 18 is the latest version, while Java 17, 11 and 8 are the current long-term support (LTS) versions. Oracle released the last zero-cost public update for the legacy version Java 8 LTS in January 2019 for commercial use, although it will otherwise still support Java 8 with public updates for personal use indefinitely. Other vendors have begun to offer zero-cost builds of OpenJDK 8 and 11 that are still receiving security and other upgrades.

6.1.1 History:

Java was originally designed for interactive television, but it was too advanced for the digital cable television industry at the time. The language was initially called Oak after an oak tree that stood outside Gosling's office. Later the project went by the name Green and was finally renamed Java, from Java coffee, a type of coffee from Indonesia. Gosling designed Java with a C/C++-style syntax that system and application programmers would find familiar.

6.1.2 Principles:

There were five primary goals in the creation of the Java language:

1. It must be simple, object-oriented, and familiar.
2. It must be robust and secure
3. It must be architecture-neutral and portable.
4. It must execute with high performance
5. It must be interpreted, threaded, and dynamic.

6.2 Introduction to MySQL 8:

MySQL is an open-source relational database management system (RDBMS) Its me is a combination of "My" the name of co-founder Michael Widenius's daughter, and "SQL", the abbreviation for Structured Query Language. A relational database organizes data into one or more data tables in which data may be related to each other, these relations help structure the data SQL is a language programmers use to create, modify and extract data from the relational database, as well as control user access to the database. In addition to relational databases and SQL, an RDBMS like MySQL works with an operating system to implement a relational database in a computer's storage system, manages users, allows for network access and facilitates testing database integrity and creation of backups.

6.2.1 History:

MySQL was created by a Swedish company, MySQL AB, founded by Swedes David Axmark Allan Larsson and Finland Swede Michael "Monty" Widenius. Original development of MySQL by Widenius and Axmark began in 1994. The first version of MySQL appeared on 23 May 1995 It was initially created for personal usage from mSQL based on the low-level language ISIAM which the creators considered too slow and inflexible. They created a new SQL, interface, while keeping the same API as mSQL. By keeping the API consistent with the mSQL system, many developers were able to use MySQL instead of the (proprietary licensed) mSQL antecedent.

6.2.2 Features:

MySQL is offered under two different editions the open source My SQL Community Server and the proprietary Enterprise Server Enterprise Server is differentiated by a series of proprietary extensions which install as server plugins, but otherwise shares the version numbering system and is built from the same code base.

Major features as available in MySQL 5.6:

- A broad subset of ANSI SQL 99, as well as extensions
- Cross-platform support
- Stored procedures, using a procedural language that closely adheres to SQL/PSM
- Triggers
- Cursors
- Updatable views
- Online Data Definition Language (DDL) when using the InnoDB Storage Engine
- Information schema
- Performance Schema that collects and aggregates statistics about server execution and query performance for monitoring purposes.

- A set of SQL. Mode options to control runtime behavior, including a strict mode to better
- Adhere to SQL standards.
- X/Open XA distributed transaction processing (DIP) support; two phase commit as part of this using the default InnoDB storage engine.
- Transactions with save points when using the default InnoDB Storage Engine. The NDB Cluster Storage Engine also supports transactions.

6.2.3 MySQL Workbench:

MySQL. Workbench is the integrated environment for MySQL. It was developed by MySQL AB, and enables users to graphically administer My SQL databases and visually design database structures.

MySQL Workbench is available in three editions: the regular free and open source Community Edition which may be downloaded from the MySQL website, and the proprietary Standard Edition which extends and improves the feature set of the Community Edition, and the MySQL Cluster CGE.

Chapter 8

Future Scope

This system has been designed keeping in mind the requirements of gram panchayat staff and enables the admin and staff of panchayat to make entries in the database about villagers details, and their related services. This system also provides him the authority to manipulate his account. By using this system data collected from different gram panchayats will be helpful for implementing different schemes and will help in natural calamities and data can be useful in other fields.

- Automation of internal workflow processes of Panchayats
- Improving delivery of services to citizens
- Capacity building of Panchayat Representatives and Officials
- Social Audit
- Transparency, Accountability, Efficiency and RTI compliance of Panchayats,
- Improving Governance of local self-government.

Chapter 9

Conclusion

The contribution of computers in our daily life, almost in every respective fields of life as emerged rapidly since from the time it has been invented Computers play very important roll of casing out the complications of the major aspect into a minor one. This project of mine deals with management system in computerized manner. The aim of this system was to reduce the manual work and the errors generated in it. In the today's computer area, the automation of the work of the management system helps to increase the speed of operation. Also the overall performance of the system and accuracy is increased. The tests carried out on this project reported that the software is totally bugged free. I feel that this epic endeavor that we stepped into results in a system that performs all the functions that it is expected to do. Computer results achieve the proper check of data maintaining consistency, proper validation checks and also checked the specific data entry points. This web based application will be helpful to the villagers of that village; it will bring transparency, accountability, and efficiency in administration. This will help to minimize corruption in the system, and also save the effort and time of common man and government officers.
